- Remove the email line shown under the user's name at the top of the Profile page. The header should only show the profile photo, name, and bio. Move the bio up to sit under the name so there's no empty gap where the email was, but leave comfortable spacing between them so it doesn't look cramped.

- On the Notifications screen, change the Streak Reminder's description from "A heads-up at 8 PM if your streak is about to end" to: “A heads-up if your streak is about to end” The reminder itself still goes out at 8 PM. Only the description text changes.

● Update the “not ready yet” text on the Insights tab

When the user has entries but their mood breakdown and reflection for the selected period aren’t ready yet:

1. **Mood Breakdown card:** change “Your mood patterns will appear here once your [weekly/monthly/yearly] reflection unlocks. Unlocks on [date].” to:

   Your mood breakdown will show here after a full [week/month/year] of journaling.

   Ready on [date].

   All text in this card should be centered.

2. **Reflection card:** change “Keep Journaling. Your [Weekly/Monthly/Yearly] Reflection will unlock after a full [week/month/year] of journaling! Your next reflection will be ready on [date].” to:

   Your [weekly/monthly/yearly] reflection will show here after a full

[week/month/year] of journaling. Keep going!

Ready on [date].

All text in this card should stay left-aligned, including the "[WEEKLY/MONTHLY/YEARLY] REFLECTION" label.

3. The words change to match the selected tab, and the date is the day it'll be ready (for example, "Ready on September 7, 2027").

● Circles Tab: Order of Circles

1. The circles under YOUR CIRCLES should be sorted by most recent activity, with the most recently active circle at the top.
2. Activity means a new post or a new reply in that circle, from anyone, including the user.
3. When a circle gets new activity, it moves to the top of the list.
4. When a user joins or creates a circle, that also counts as activity, so the new circle goes to the top of their list. If nothing happens in that circle after that, it moves lower as their other circles get new posts and replies.
5. Archived circles always stay at the bottom of the list, below all active circles. Among themselves, they follow the same order: most recent activity first.
6. The order should update in real time. If someone posts in a circle while the user is on the Circles tab, that circle moves to the top without the user needing to refresh.
7. This applies to every circle in the list, Public or Private, whether the user is the owner or a member.

● Circles Tab: Colored Icons on Circle Cards

See the attached screenshot for how it should look.

1. The Circles tab stays as it is now. The header, subtitle, the Create a circle and Discover circles cards, the YOUR CIRCLES label, and the bottom tabs don't change.
2. The only change is to the circle cards under YOUR CIRCLES. Each card gets a colored circle icon on the left side, next to the circle's name.
    - Public Circles get a light green circle (#B9E8CB) with a dark green globe icon (#1F5C3C).
    - Private Circles get a light purple circle (#EADBF8) with a dark purple lock icon (#5A1F9A).
3. The icon circle should be about 46px wide, vertically centered in the card, with about 12px of space between it and the text.
4. Remove the small globe or lock icon that currently sits before "Public · Owner" or "Private · Owner." The new colored icon replaces it. The line itself stays, so it still reads "Public · Owner," "Private · Member," and so on.
5. The circle's name, the Public/Private · Owner/Member line, and the arrow on the right stay the same.
6. Archived circles: the colored icon fades along with the rest of the card, and archived cards stay at the bottom of the list as they do now.
7. This applies to every circle in the YOUR CIRCLES list, whether the user owns it or is a member.

● Update the empty Journal tab for new users

1. **Greeting:** when a user first joins and has no entries, the header currently says "Hello, there." Change it to use the same time-of-day greeting with the user's first name that the Journal tab already uses for everyone else (for example, "Good afternoon, Konah"). There should always be a name saved, it needs to pull a name 100 percent of the time.
2. **Empty journal text:** in the "Your journal is empty" card, change "Tap the + button to log your first mood and write what's on your mind." to: "Tap + New Entry to log your first mood and write what's on your mind."

● Update the empty state on the Insights tab

When the user hasn't made any journal entries yet:

1. Change the section label above the card from "MOOD BREAKDOWN" to "MOODS & REFLECTIONS."
2. Change the text in the card from "Your mood patterns will appear here once your weekly reflection unlocks." to:

    Week tab: "Start journaling to see your mood breakdown and weekly reflection here."

    Month tab: "Start journaling to see your mood breakdown and monthly reflection here."

    Year tab: "Start journaling to see your mood breakdown and yearly reflection here."

This only applies when the user has no entries. Once they make their first entry, the screen switches to the normal layout, with the "MOOD BREAKDOWN" and "REFLECTIONS" sections like it does now.

● Notifications page in onboarding: small updates

1. Change "Early Evening" to "Early evening," so it matches the style of the other options.
2. Change "Add one later" to "Maybe later."
3. Preselect "Before bed (9:00 PM)" when the page opens, so the "Turn on reminders" button is active right away. The user can still tap any other option to change it.
4. Add a small line of gray text right under the "Custom time" option: "You can change this anytime in Profile → Notifications."

- # Verified badges for well-known users

When celebrities and influencers join LYSM, people could pretend to be them by copying their name, profile picture, and bio, for example to run a fake Public Circle. To prevent this, add a verified badge that only we can give out.

1. Admin-only verified setting

Add a “verified” setting (on/off) to user accounts.

Only admins can turn it on or off, for example directly in Supabase. There’s no way for users to request it or turn it on themselves in the app.

I’ll handle verifying people manually outside the app. When someone is confirmed, I’ll let you know or turn it on myself.

2. The verified badge

Verified users get a small purple check mark badge right after their name.

It should show everywhere their name appears: posts, prompts, replies, member lists, in-app banners and notifications, and the header of circles they own.

In Discover, Public Circles owned by a verified user should show the badge next to the owner’s name.

If the setting is turned off, the badge disappears everywhere right away.

3. Block fake check marks in names

Don’t allow check mark characters or emojis in names, including ✓, ✔, ☑, ✅, and ☑️, so no one can fake the badge by typing it.

If someone tries, show: “Names can’t include check marks or verification symbols.”

This applies when creating an account and when editing a name in Edit Profile.

- ## Fix nested replies in Private Circles

In Private Circles, replying to someone's reply doesn't work correctly. For example, I make a post, Auguste replies to it, and then I tap Reply on Auguste's message. My reply shows up as a reply to my original post instead of a reply to Auguste's message.

Replies in Private Circles should work exactly the way they already do in Public Circles:

1. When a user taps Reply on someone's reply, the new reply should be attached to that specific reply, not to the main post.
2. It should show underneath the message it's replying to, the same way Public Circles display it.
3. Whoever's message was replied to should be clearly shown, the same way Public Circles show it.

Since this already works in Public Circles, please use the same reply setup for Private Circles so the two behave the same.

- On the home page, the "Today's Moods" card should open a new journal entry when tapped anywhere within it, not just when tapping directly on one of the mood circles. Right now, tapping a mood circle already opens a new entry — that behavior should stay exactly as it is. The fix is to extend that same tap target to the rest of the card, so tapping the card background, the header, or any other empty space within the section also opens a new entry, the same as tapping a mood does now.

- ## Fix the text box disappearing behind the keyboard on "Let's try your first check in"

  On the onboarding screen "Let's try your first check in.", when the user taps the "What's on your mind?" text box and the keyboard opens, the text box is currently squished or hidden. Only the label and the "Save & reflect" button are visible. The text box should be visible on screen by default, without needing to scroll down. When the keyboard opens, the screen

should automatically scroll so the text box is fully visible and centered in the space above the keyboard. The user should be able to see what they're typing the whole time. The text box should keep its normal size when the keyboard is open, never shrink or collapse. As the user types more lines, the screen should keep scrolling so the line they're typing stays visible above the keyboard. While typing, the user should still be able to scroll up and down the screen without the keyboard closing or the text box losing focus. If the user taps anything outside the text box, like a mood, the keyboard closes and they leave the text box. Everything they typed stays, and they can tap back into the text box to keep typing where they left off.

- ## Make circles update in real time + in-app notifications

Right now, in both Public and Private Circles, new posts, prompts, and replies don't show up until the user leaves the circle and opens it again. Notifications already work. For example, if Auguste replies while I'm in the circle, I get a notification that he replied, but his reply doesn't appear on the screen until I leave and come back. If two people are talking in a Private Circle, they shouldn't have to keep leaving and coming back to see each other's replies.

Real-time updates in circles

1. New posts, prompts, and replies from other members should appear on their own, without the user leaving the circle or pulling to refresh.
2. Likes, reply counts, edits, and deleted posts should also update live.
3. If the user is scrolled down reading older posts when something new comes in, don't jump them to the top. Instead, show a small "New posts" button at the top that takes them to the new content when tapped.
4. When the user opens a circle, or comes back to the app after it was in the background, it should load anything new right away.
5. This applies to both Public and Private Circles.

Notifications while the user is in the app (applies to every notification type)

6. **No push notifications while the app is open:** never send an iOS or Android push notification while the user has the app open, no matter what it's for (circle

activity, reflections, journaling reminders, streak reminders, archived circles, and anything else). Push notifications should only go out when the app is closed or in the background.

7. **In-app banners instead:** while the user is in the app, every notification should show as an in-app banner that slides down from the top of the screen, similar to Instagram.

    Tapping the banner takes the user to whatever the notification is about.

    The banner disappears on its own after about 4 seconds, or the user can swipe it up to dismiss it.

    Banners follow the same notification settings as push notifications. If a notification type is turned off, no banner shows.

8. **No notifications on these screens:** don't show any banners while the user is in onboarding, on the paywall, on the sign-in or sign-up screens, or while the crisis resources pop-up is open. Anything that comes in during that time should still be saved to the in-app notifications list.

Circle activity banners

9. **Top line:** "[Name] in [Circle name]" for a post, or "[Name] replied in [Circle name]" for a reply. **Second line:** a one-line preview of what they wrote. Tapping it opens the circle and goes straight to the post.

10. If several posts come in at once, combine them into one banner, like "Auguste and 2 others posted in Konah's Friends."

11. If the user is already viewing the circle where the activity happened, don't show a banner, since they'll see it appear live.

12. Banners follow each circle's notification setting (the bell icon). If notifications are off for that circle, no banner shows.

Weekly, monthly, and yearly reflection notifications

These already work this way. No changes needed, just making sure they stay as is:

13. Reflections become available at midnight on the day they're ready, but the notification goes out at 9 AM in the user's local time.

14. If the user already opened that reflection before 9 AM (for example, they were up at midnight and read it), don't send the 9 AM notification for it.

New:

15. If the user is in the app at 9 AM (for example, writing a journal entry), show the reflection notification as an in-app banner instead of a push notification, following point 7. Tapping it opens that reflection on the Insights tab.
16. If more than one reflection is ready on the same day, send one notification for all of them, like “Your weekly and monthly reflections are ready.” Tapping it opens the Insights tab.

Streak reminder

17. If the user has an active streak and hasn’t journaled yet that day, and they’re in the app at 8 PM, show the streak reminder as an in-app banner instead of a push notification, following point 7. Tapping it takes them straight to the Journal tab.

Public Circle join notifications

18. When someone joins a Public Circle, send a notification to the circle’s owner: “[Name] joined [Circle name].” Tapping it opens the circle’s Members tab.
19. If several people join close together, combine them into one notification, like “Auguste and 4 others joined Konah Public Circle.”
20. This notification is on by default. The owner can turn it off in the circle’s notification settings (the bell icon), with its own toggle, for example “New members.”
21. It follows the same in-app rules as every other notification: in-app banner if the app is open, push notification if it’s closed.

● Update the “No circles yet” text on the Circles tab

On the Circles tab, change the text in the “No circles yet” card to:

“Create a circle and invite people, or join one with a code. Once you’re in one, you can share your mood along with your AI reflection or written entry, and post with others in the circle.”

The title “No circles yet” stays the same. This card should only show when the user isn’t in any circles. Once they create or join one, it’s replaced by their list of circles.

- **Bug: users who sign up via "Continue with Google" or "Continue with Apple" aren't getting a name pulled from that account — the home screen greeting shows the literal placeholder "Good Evening, there" instead of an actual name.**

Fix: pull the user's name from the Google or Apple account they signed up with, and use it automatically. Users can still change their name afterward in Profile settings if they want — this doesn't lock anything in, it just gives every account a real name from the start instead of a broken placeholder.

One critical, Apple-specific detail that has to be handled correctly, since it can't be fixed after the fact: Apple only includes the user's name in the sign-in response on the very first authorization a user ever grants your app — every sign-in after that, Apple returns nothing for the name field at all, permanently, even if the app asks again. This means the name has to be captured and saved to the user's profile at the exact moment of that first authorization, not fetched on-demand later. Two things worth Muhammad checking specifically:

1. Whether the app's Sign in with Apple request is even asking for the name (the `fullName` scope) — if that scope was never requested, Apple won't return a name at all, first authorization or not.
2. Whether this was being captured and saved at that first-authorization moment, or just not read from the response at all.

Important consequence for users who already signed up via Apple and got the broken "there" placeholder: since Apple won't return the name again on future sign-ins, this fix only prevents the bug for new sign-ups going forward. Anyone already affected can't have their name automatically recovered — they'll need to set it manually in Profile settings. Google sign-in doesn't have this same one-time limitation, so any Google-based accounts affected should be able to get their name pulled retroactively without issue.

- **On the "You're all set" trial confirmation screen, the icon in the middle changes — screen recording of the target animation is attached below.**

What it looks like now, and what it's replacing: currently a checkmark circle surrounded by a lighter purple halo ring, with several small colored dots scattered around it. Remove the halo ring and all the dots entirely.

What it should be instead: just a solid purple circle with a white checkmark inside it. Nothing else around it.

Entrance animation, plays once when the screen appears, then holds still:

1. The purple circle pops in first — scales up from slightly smaller to full size while fading in, with a slight bounce/overshoot on the scale rather than a flat linear motion.
2. Right after the circle settles, the checkmark draws itself in with a quick stroke animation — it should look like it's being drawn stroke-by-stroke, not just fading into view all at once.
3. Once the checkmark finishes drawing, everything holds completely still. No looping, no continuous pulsing — this is a one-time entrance, not an ongoing animation.

Total sequence should feel quick, well under a second — the recording attached shows the actual intended timing and feel.

- **Grammar bug on two onboarding summary screens — both share the same root cause, not two separate typos.**

  What's happening: these screens insert the short label text from an earlier multiple-choice answer directly into a new sentence, without adjusting its word form to fit. A label written as a noun for a button ("Managing stress," "Most days") doesn't automatically become the right word form when dropped into a different sentence structure later.

  Example 1 — "The shift you're working toward" screen: currently shows "Right now: Stress most days." Should be "Right now: Stressed

most days" — "Stress" is a noun, but the sentence needs an adjective describing the person's current state.

Example 2 — the 100% onboarding summary checklist: currently shows "Steadying the overwhelm that shows up most days." This doesn't read naturally — "overwhelm" as a bare noun here is awkward, especially since the actual onboarding question asked "how often do you feel overwhelmed" (the adjective form). Confirmed final wording: "Steadying the days that overwhelm you most" — uses "overwhelm" as a verb instead of a noun, which fixes the awkwardness while still carrying the frequency idea.

What to actually check: the two examples above are only from the specific answers I selected during my own onboarding — each onboarding question has multiple possible answers, and different combinations of selections generate different versions of these sentences, most of which I haven't personally seen. Since this is a word-form mismatch between quiz-answer labels and the sentence templates they get inserted into, the same bug could easily be sitting in other answer combinations I never tested. The fix isn't just correcting these two specific lines — it's checking every sentence template against every possible answer that could get inserted into it, so it reads correctly no matter which options a given user actually selected.

- **On the Send Feedback screen, the category selector needs two changes: a wording change and a visual update. Reference image attached below.**

Wording: "Praise" is being replaced with "What's working" — it reuses language already in the subtext right above it ("Tell us what's working or what could be better") and is more accurately scoped to specific feedback on something that's landing well, rather than implying general enthusiasm for the app as a whole. Final set: Idea, Bug, What's working, Other.

They stay as separate individual pills, not one connected track like the Week/Month/Year selector on Insights — this is specifically about how each pill looks, not about merging them into a single control.

Selected pill: solid purple fill, white text — bold and unmistakable, not the current light purple tint with a thin border.

Unselected pills: white background, no border, with a soft drop shadow underneath for depth. This replaces the current flat outline look, which reads as underweighted and unfinished sitting on the cream background.

Everything else about this screen (layout, spacing, the message box below it) stays the same — this is just the pill styling itself.

- **Bug: when a period has zero journal entries, the Weekly Reflection card (and, it turns out, the Mood Breakdown card as well — see Fix below) doesn't show an empty state — it keeps displaying stale content from a completely different, earlier period, while still labeling it with the current period's date range.**

  Reported case: entries were made during Sep 14–20, and the reflection text (workout, getting matcha with Augie, etc.) is genuinely correct for that period — that part worked as expected. The empty period tested was the following week, Sep 21–27, where no entries were made at all. Once that period ended, the card should have advanced to Sep 21–27 and shown an empty state for it, but instead it stayed completely frozen on the Sep 14–20 reflection — both the date label and the content. The bug is that a period with zero entries doesn't cause the card to advance at all; it just gets stuck displaying the last period that actually had content.

  Fix: this applies to both the Weekly Reflection card and the Mood Breakdown card — both need the same empty-state behavior when a period has zero entries, not just Reflection. Neither should get stuck showing an old period's content when the current one is empty.

  Wording should be consistent between the two cards, closely matching Mood Breakdown's existing empty-state pattern rather than introducing separate phrasing for each: Mood Breakdown already says "No entries in this period yet. Log a mood to see your patterns here." — Reflection

should follow the same structure, something like "No entries in this period yet. Journal to see your reflection here."

Important: this empty state is not permanent, but it also doesn't refresh early just because a user starts journaling again — it follows the exact same once-per-period locking schedule as everything else, not an instant update the moment a new entry is logged. Example: Sep 21–27 has zero entries, so the empty state appears on Sep 28 (when that period would normally unlock) and stays displayed through the entire next period, Sep 28–Oct 4 — even if the user resumes journaling on Sep 28, the empty state for Sep 21–27 stays on screen the whole time, since Sep 28–Oct 4's own reflection isn't ready yet. Only on Oct 5, when Sep 28–Oct 4 unlocks, does the card update — and only then does it show a real reflection, assuming the user actually journaled during that period. If Sep 28–Oct 4 also ends up with zero entries, the card would show the empty state again on Oct 5, not a fallback to Sep 21–27's empty state or anything else.

The empty state doesn't replace the whole card, just the main reflection text. The surrounding metadata should still show exactly as it does for a real reflection — "Reflecting on [date range]" for the period that was empty, and "Your next reflection will be ready on [date]" below it. A user should still be able to see which period had nothing logged and when the next one unlocks, even while looking at the empty state. This applies to the Mood Breakdown card too, with whatever equivalent period/next-ready information it should be showing alongside its own empty-state message.

This should apply to all three views — weekly, monthly, and yearly — for both cards, not just weekly, same as the original locking spec.

Notification behavior for empty periods: the weekly, monthly, and yearly reflection notifications (from the main Notifications spec) should only fire when a period unlocks with a real reflection actually generated from real entries. If a period is empty and shows the empty state instead, the notification should not fire at all — this holds regardless of whether the user has that notification setting enabled. No "your recap is ready" notification should ever lead to an empty state on the other end; if there's nothing real to show, there's nothing to notify about. Applies uniformly to weekly, monthly, and yearly.

- **On the Today's Moods card, the streak indicator in the top-right corner (hourglass + flame + number, shown in the urgent state) currently uses custom-drawn icons that look off — not like real emoji, more like generic line-art approximations of them.**

  Fix: use the actual native emoji characters instead of custom icons — 🔥 for the flame and ⏳ for the hourglass. These should render as the real, full-color emoji built into the phone (Apple's on iPhone, the phone's own on Android), not a custom SVG or icon-font substitute standing in for them.

- **Account linking — when a sign-in method doesn't match how the account was originally created, but the email matches an existing account.**

Current bug: right now this just silently blocks the user with no explanation at all.

General principle: whenever a sign-in attempt's email matches an existing account, trigger a linking flow instead of blocking — but never merge automatically. Always verify it's genuinely the same person first. Which verification method to use depends on how the existing account was originally created:

> If the existing account has a password (created via email + password) → verify by entering that password.
>
> If the existing account has no password (created via Google or Apple only) → verify by re-authenticating through whichever provider the account was originally created with.

All six scenarios, and what verification each one needs:

> **Email + password account → signs in with Google → enter original password**

Email + password account → signs in with Apple → enter original password

Google account → signs in with Apple → re-authenticate through Google

Google account → signs in with email + password → re-authenticate through Google, then set a new password

Apple account → signs in with Google → re-authenticate through Apple

Apple account → signs in with email + password → re-authenticate through Apple, then set a new password

The two "set a new password" rows are different from the others — the user isn't confirming an existing credential, they're creating a brand new one that's never existed for this account. That should only happen after the re-authentication step succeeds, not before.

Apple "Hide My Email" — a cross-cutting issue affecting every scenario involving Apple, not just one. When someone signs in with Apple, they can choose to share a private relay address (e.g., xyz123@privaterelay.appleid.com) instead of their real email. Google always returns the person's actual email, with no equivalent privacy option. This means: if Apple is involved anywhere in a user's sign-in history — as the original method or a later attempt — and they used Hide My Email, the email on file won't match what the other provider hands back, even though it's genuinely the same person. The automatic email-matching trigger won't fire, and without a fallback, this could silently create a second, disconnected account for someone who already has one. This needs an explicit fallback (e.g., prompting the user to confirm manually if a match seems likely, or some other method) — not just assumed away, since it's a real path users can hit any time Apple sign-in is one of the methods involved.

Important: nothing gets discarded when a new method is linked. All linked methods stay fully functional side by side afterward. The user would still be able to sign in with their original email and password, or with Google, or with Apple — any of the three leads to the same single account. Linking adds a way in, it never removes one that already existed.

● Add an easier way to leave a circle

Right now, members who didn’t create a circle can only leave it by opening the Members tab and scrolling to the bottom of the list. That won’t work well once circles have hundreds or thousands of members. Please:

> For members who aren’t the owner, add a ••• button in the top right of the circle, in the same spot where owners see the Circle Settings gear icon.
>
> Tapping it opens a small menu with “Leave circle” in red.
>
> Before leaving, show a confirmation: “Leave [circle name]?” with “Leave” and “Cancel” buttons. For private circles, add: “You’ll need a new invite to rejoin.”
>
> Keep the “Leave circle” option at the bottom of the Members tab too.
>
> Members should still be able to leave a circle after it’s been archived.
>
> Nothing changes for owners. They still see the gear icon and delete or archive the circle from Circle Settings.

● Email and password: full spec

Covers email verification at sign-up, changing email and password inside the app, forgot password, and Apple's "Hide My Email" addresses. Linking Google, Apple, and email sign-in to one account is covered in the Account linking section. This one covers everything around it.

Where the in-app changes live: a new row on the Profile page called "Sign-in & Security," placed near Subscription, with a short description under it like the other rows (for example, "Email and password"). Tapping it opens a screen with an

"Email" row and a "Password" row. Nothing for changing email or password goes on the sign-in page. The sign-in page only has "Forgot password," for people who can't get in. Accounts created with only Google or Apple see "Set a password" instead of "Password" (see section 3).

1. Verify email right after Create Account (email + password sign-ups only)

Who it applies to: only email + password sign-ups. Google and Apple already verify the email themselves, so those users skip this step.

Where it goes: immediately after the user taps Create Account, before the paywall. They can't continue to the paywall until the email is verified. This keeps the screens after the paywall at the two that exist now (trial confirmation and notifications).

How it works: a short code (for example, 6 digits) is emailed, and the user types it into the app. A code, not a link, because a link sends people off to their mail app and some never come back.

The screen includes two options: "Resend code" (with a short cooldown) and "Wrong email? Change it." The second one fixes a typo by updating the email on the unverified account and sending a fresh code. Without these, the step is a dead end for the exact mistake it exists to catch. Codes should expire after a short window.

Why it's required: someone who mistypes their own email, or uses an address that isn't theirs, can journal for weeks without knowing. The real owner of that address could then use "Forgot password" and get into the journal. The real user would also never receive a reset email. Verification catches it while it can still be fixed. It also stops unverified accounts from squatting on someone else's email, which is what makes email-match account linking safe.

Older accounts: the existing rule that you must verify before joining a circle stays as a backstop. Accounts created before this step existed (including test accounts) should be asked to verify the next time the app opens, not only when they try to join a circle.

Linking: only verified emails should be able to trigger email-match account linking.

2. Change email (inside the app, signed in only)

A confirmation code goes only to the new address, and the user types it into the app. The change doesn't take effect until it's confirmed. Nothing is required from the old address, because losing access to the old email is one of the main reasons people change it.

After the change goes through, send a heads-up to the old address saying the email was changed. It requires no action and doesn't block anything. If someone ever swaps the email on an account that isn't theirs, the real owner at least finds out.

If the new email already belongs to another LYSM account, block the change with a clear message. Never merge the two accounts.

Require the current password before an email change. This keeps someone holding an unlocked phone from taking over the account. The one rare case it can't cover is a user who is signed in, forgot their password, and no longer has access to their old email. Send those users to support rather than weakening the check.

Google/Apple-only accounts: email is read-only, since the provider controls it. The one exception is Apple relay addresses (section 5).

Linked sign-in must survive an email change. Once Google or Apple is linked, the app should recognize that provider by its own account ID, not by the email text. Otherwise changing the email in LYSM quietly breaks Google or Apple sign-in.

3. Change password and Set a password (inside the app)

Accounts with a password: changing it requires the current password. The change screen also includes "Forgot your current password?", which sends the same reset email as the sign-in page's "Forgot password" so nobody hits a dead end.

After a password change, sign out the user's other devices.

Accounts with no password (Google or Apple only): the row says "Set a password." The user must re-authenticate through the provider the account was created with first, and then can create a password. This matches the "set a new password" rows in the account linking table.

4. Forgot password (sign-in page)

This stays the only way back in for someone who's locked out.

If the account is Google or Apple only, don't send an email. Block the request on screen with a clear message instead, so the user isn't left waiting for an email that will never come: "This account uses Google sign-in, so there's no password to reset. Sign in with Google, or set a password under Sign-in & Security once you're in." Name the provider the account was actually created with (Google or Apple).

If no account exists, no email is sent.

Password reset uses a code, not a link, the same as email verification. The email contains a short code (for example, 6 digits) that the user types into the app before choosing a new password. Codes expire after a short window, work only once, and lock after a few wrong attempts (the user can then request a new one). Resetting a password signs out the user's other devices. **None of this is assumed to exist today, and all of it needs to be built:** code expiry, single use, the lockout after wrong attempts, and signing out other devices after a reset or a password change.

5. Apple "Hide My Email" (private relay) addresses

Delivery: emails sent to Apple relay addresses (they end in privaterelay.appleid.com) only arrive if LYSM's sending domain and From address are registered with Apple. Otherwise they bounce. This affects anything LYSM emails to a relay address, such as password resets for an Apple-created account that later sets a password. Register the sending domain with Apple and make sure the SPF record is set up correctly. This is not assumed to be set up today, and it needs to be done.

Sign-in with a relay address: an Apple-only user who sets a password would have to sign in with email using a relay address they never see. **Let these users replace the relay address with their real email,** confirmed by a code sent to the new address, the same as section 2. This is the one exception to "email is read-only for Google/Apple accounts." It also fixes the matching problem in account linking, where a relay address never matches the real email Google returns.

- ## Move Reflection Tone out of Edit Profile and into its own row

  Remove the reflection tone setting from the Edit Profile screen. Edit Profile should only include name, photo, and bio. Its subtitle stays "Update your name, photo, and bio." On the Profile page, add a new row in the Account section, directly below Edit Profile, styled the same as the other rows (icon, title, subtitle, arrow):

  Title: Reflection Tone

  Subtitle: Choose how your AI reflections are written

  Tapping the row opens a Reflection Tone screen showing the same 4 tones from onboarding: gentle, direct, encouraging, and reflective. The rules are the same as onboarding: users must pick at least 1 and can pick up to 2. Their current selection should already be shown when the screen opens.

- ## Help & FAQ Page Updates

The design stays the same. Only the wording and the order change.

1. Remove these cards:

How do I get my trusted connections?

Can I control what each person sees?

2. Replace all FAQ cards with the following, in this exact order:

I'm in crisis. What should I do?
If you're in danger or thinking about harming yourself, please call 911 or call/text 988 (Suicide & Crisis Lifeline). LYSM also surfaces support resources when it detects concerning words as you write.

How do I log my mood?
Tap the + New Entry button on the Journal tab, choose how you feel, write anything on your mind, then tap Save Entry.

Can I edit or delete an entry?

Open an entry and tap the pencil to edit or the trash can to delete.

What are AI reflections?
After you save an entry, LYSM writes a short reflection on it in the tone you picked (gentle, direct, encouraging, or reflective). Open the entry to read it. Change your tone in Profile → Reflection Tone.

How do I leave a circle?

Open the circle and tap the three dots in the top right, then Leave circle. If you are the owner of the circle, you can archive or delete it in Circle Settings.

Who can see my journal?
Your entries are private by default. Only entries you explicitly share to a circle are visible. When you share, your mood is always included, and you choose whether to share your AI reflection or your written entry.

How do Circles work?
Private Circles are invite-only groups for people you trust, where anyone can post and share entries. Public Circles are open to anyone: someone posts a prompt and others respond. Create or join a circle from the Circles tab.

How do streaks work?
Your streak counts consecutive days with at least one entry. See the Insights tab.

How do I change or cancel my subscription?
Profile → Subscription opens your App Store or Google Play settings, where you can update or cancel anytime. Canceling during your free trial means you won't be charged.

How do I contact support?
Email support@lysm.app. If there's something you'd like us to know, you can also go to the Send Feedback page and share your thoughts there. We read everything.

How do I delete my account?
Go to Profile, scroll to the bottom, and tap Delete Account. This permanently deletes your account and all your entries.

● Add archiving to Public Circles

Right now only Private Circles can be archived. Please add the same Archive option to Public Circles, in Circle Settings next to “Delete circle,” for the circle’s owner.

When a Public Circle is archived:

1. People who already joined can still open it and read all the posts and replies.
2. No one can post or reply anymore.
3. It no longer shows up in Discover, and no one new can join.
4. Show a small label at the top of the circle: “This circle has been archived.”

Unarchiving (Public and Private Circles):
5. Owners should be able to unarchive both Public and Private Circles from Circle Settings. When a circle is archived, the “Archive circle” option should change to “Unarchive circle.”
6. Unarchiving brings the circle back to normal: posting and replies work again, and a Public Circle shows up in Discover again.

Archived circles on the Circles tab (Public and Private Circles):
7. In the “Your Circles” section, archived circles should show “Archived” at the end of the gray line under the circle name, for example “Private · Owner ·

Archived” or “Public · Member · Archived.” This should show for everyone in the circle, not just the owner.
8. Slightly fade archived circle cards. As soon as a circle is archived, it should automatically move to the bottom of the user’s list, below all their active circles. When it’s unarchived, it moves back up with their active circles.

Notifications (Public and Private Circles):
9. When a circle is archived, send a notification to every member except the owner: “[Circle name] has been archived. You can still read it, but no new posts can be added.”
10. When a circle is unarchived, send a notification to every member except the owner: “[Circle name] is active again. You can post and reply again.”
11. These should follow each member’s notification setting for that circle (the bell icon). If they’ve turned notifications off for that circle, they don’t get a push notification, but they still see it in the app’s notifications list.

- # Streak Popup Spec

1. Layout

Keep the current popup design (buttons, styling), but remove the checkmark icon at the top. Replace the headline "1 day journaling, and counting" with three parts, stacked and centered. See the attached screenshot for the exact look.

> The flame emoji and the user's current streak number side by side on one line, close together, with the number large and bold in the same serif font as the app's headings
>
> "DAY STREAK" in smaller text directly under the number
>
> A message line under that, in smaller, softer text (see the rules below)

The streak number must always match the streak shown on the Journal tab, Insights, and Profile.

2. Buttons

Keep "See AI summary" as is.

Change "Go back to home" to "Back to home."

3. Which message to show

Each day gets one message. Check these in order and use the first one that applies:

1. Starting over after a broken streak
2. Milestone day
3. New longest streak
4. Day before a milestone
5. Regular day

4. Milestone messages

Day 1: Great start. Come back tomorrow to make it 2.

Day 3: 3 days in a row. You’re building something here. See you tomorrow.

Day 7: One full week! Let’s start week two tomorrow.

Day 14: Two weeks of checking in. Keep it going tomorrow.

Day 30: A whole month of showing up. Keep it going tomorrow.

Day 50: 50 days. Halfway to 100. See you tomorrow.

Day 100: 100 days. Tomorrow starts the next hundred.

Day 150: 150 days of showing up for yourself. See you tomorrow.

Day 200: 200 days. That’s who you are now. See you tomorrow.

Day 250: 250 days. A quarter of the way to 1,000. See you tomorrow.

Day 300: 300 days. One year is right around the corner.

Day 365: One full year of journaling. Tomorrow starts year two.

Day 500: 500 days. Few people ever get here. See you tomorrow.

Day 1,000: 1,000 days. Truly incredible. See you tomorrow.

After day 365, these also count as milestones:

Every yearly anniversary (730, 1,095, 1,460, and so on): "[Y] years of journaling. Tomorrow starts year [Y+1]." Here [Y] is the number of years.

Every 100 days not listed above (400, 600, 700, 800, 900, 1,100, and so on): "[X] days. See you tomorrow for [X+1]."

If a day is both a yearly anniversary and on another list, use the anniversary message.

5. New longest streak

“Your longest streak yet. Let's beat it again tomorrow.”

Show this only on the first day the user passes their previous longest streak, not on every day after.

Never show it during a user's first-ever streak.

6. Day before a milestone

Tomorrow is day [X]. Don't miss it.

[X] is the next milestone day. This applies to every milestone in section 4, including anniversaries and every-100-days milestones. For example, on day 29: "Tomorrow is day 30. Don't miss it."

7. Starting over after a broken streak

If the user is on day 1 but has had a streak before, show this instead of the regular day 1 message:

Every streak starts with day 1. Come back tomorrow to make it 2.

8. Regular days

For any day that doesn't fit the rules above, randomly pick one of these lines:

> See you tomorrow for day [X+1].
>
> Day [X] done. Tomorrow makes [X+1].
>
> Another day for you. See you tomorrow.
>
> Keep showing up. Day [X+1] is tomorrow.

Do not show the same line two days in a row.

9. Formatting

> Replace [X] with the user's current streak number, and [X+1] with the next day's number.
>
> Use commas in numbers 1,000 and higher.

10. More than one entry on the same day

The streak popup only shows for the user's first entry of the day. For a second, third, or later entry on the same day, keep showing the current "Entry complete" popup instead, since the streak doesn't go up.

● Streak milestones in the daily reminder and the streak reminder

The timing and on/off settings for both notifications stay exactly as they are now. Only the wording changes, based on the user's streak.

For everything below:

> [X] is the user's current streak, counting through yesterday.
>
> [X+1] is what their streak becomes if they journal today.

Milestone days are the same ones from the streak popup spec: 3, 7, 14, 30, 50, 100, 150, 200, 250, 300, 365, 500, and 1,000, plus every yearly anniversary (730, 1,095, and so on) and every 100 days after 365 (400, 600, 700, and so on).

1. Daily journaling reminder

Regular days: no change. Keep using the 7-prompt rotation, exactly how it works now.

Milestone days: if the user hasn't journaled yet today and [X+1] is a milestone, replace that day's rotating prompt in the notification with:

Today could be day [X+1]. Take a minute to check in.

For example: "Today could be day 30. Take a minute to check in."

If the user has already journaled today by the time the reminder goes out, use the normal rotating prompt instead.

The home page subtitle (under "Good evening, [name]") always shows the regular rotating prompt, even on milestone days. Only the notification changes.

Milestone days don't affect the rotation. The next day continues the rotation as normal.

2. Streak reminder (8 PM)

This still only sends at 8 PM when the user has an active streak and hasn't journaled yet that day. Use the first message below that applies:

1. If [X+1] is a milestone:

   Don’t lose your [X] day streak. Check in before midnight to reach day [X+1].

2. If [X+1] would beat the user's longest streak:

Check in before midnight to achieve your longest streak.

Never use this during a user's first-ever streak.

3. Otherwise: no change. Keep using the current streak reminder messages, exactly how they work now.

3. Formatting

Replace [X] and [X+1] with the actual numbers.

Use commas in numbers 1,000 and higher.

Both notifications use the user's current device timezone to decide what "today" and "midnight" mean.

● Circle description updates

1. **150-character limit:** Add a 150-character limit to the circle description in both places it appears: the Create Circle screen and the Circle Settings screen. Show a counter right below the text box that updates as the user types (0/150, 45/150, and so on), styled the same way as the counter on the profile bio. Users can't type past 150 characters.
2. **Show the description inside public circles:** When someone opens a public circle, show its description directly under the circle name at the top of the screen. Use smaller, gray text, like the helper text elsewhere in the app. If the circle has no description, leave this space out completely, with no empty gap.
3. **Remove the invite code from the feed:** Remove the invite code box from the top of the circle's Feed tab. The invite code already shows when users tap the add-person icon in the top right corner, so that's where it will live from now on. Move the Feed and Members tabs up to fill the space.

● Add dates to the Mood Breakdown card

At the bottom of the Mood Breakdown card on the Insights tab, add two lines of small text, styled the same way as the dates at the bottom of the Weekly Reflection card:

> "Your moods from [start date] to [end date]" (for example, "Your moods from Sep 28 to Oct 4")
>
> "Your breakdown will be ready on [date]." (for example, "Your breakdown will be ready on October 12, 2026.")

This applies to the weekly, monthly, and yearly views. The dates should update to match whichever view is selected, and cover the same period as that view's reflection. These two date lines only show once a mood breakdown is showing. Before that, the “not ready yet” text replaces them, so both never show at the same time.

● Remove the timezone setting and use the device's timezone automatically

1. Remove the Timezone field (and its "Use device" button and helper text) from the Edit Profile screen.
2. The app should automatically use whatever timezone the user's phone is set to. Check it every time the app opens or comes back from the background, and update it if it changed. For example, if a user on West Coast time flies to the East Coast, the app should switch to Eastern time once their phone does.
3. Streaks, the mood breakdown, and reflections should all use the user's current device timezone to decide what counts as "today."
4. Traveling should never break a streak on its own. An entry counts toward the day it was written, based on the local time on the user's phone at that moment.

● Make the crisis resources pop-up in onboarding a half-screen sheet

1. When the user taps to open the crisis resources pop-up ("You're not alone in this") during onboarding, it should slide up from the bottom and cover

only the bottom half of the screen. The top half of the onboarding screen should stay visible behind it, slightly dimmed.
2. The content inside the pop-up stays the same (988 Suicide & Crisis Lifeline, Crisis Text Line, and Outside the US). The pop-up should scroll so users can reach everything below what fits in the bottom half.
3. Add an X button in the top right corner of the pop-up. Tapping it closes the pop-up.
4. Tapping the dimmed top half of the screen should also close the pop-up.

● Redesign the sign-up and sign-in screens

I've attached images of both redesigned screens so you can see exactly what they should look like. Both screens should use the same layout so they feel like one app.

1. Shared layout (both screens)

In the center of the screen: the LYSM app icon (use the real app icon file), with the headline under it in the serif heading font and the subtext under that in smaller gray text.

At the bottom of the screen: the three sign-in buttons, stacked in this order:

1. Continue with Apple (black button, white text, white Apple logo)
2. Continue with Google (white button, light gray border, dark text, colored Google logo)
3. Continue with Email (white button, light gray border, dark text, purple envelope icon)

All three buttons should be the same size and shape, with the same text size and font. Each icon sits right next to its text, and both are centered in the button.

2. Sign-up screen (onboarding)

Keep the progress bar at the top.

Headline: "Save your progress"

Subtext: "Create your account so your plan and entries are always here for you."

Under the buttons, in small gray text: "By continuing, you agree to our Terms and Privacy Policy." "Terms" and "Privacy Policy" should be purple links that open those pages.

3. Sign-in screen (Welcome back)

Keep the back arrow in the top left corner, working the same way it does now.

No progress bar.

Headline: "Welcome back"

Subtext: "Sign in to pick up right where you left off."

Under the buttons: "Don't have an account? Get started," where "Get started" is a purple link that takes the user to onboarding.

4. Fix the loading spinner showing on the wrong button
I've attached a screenshot of this bug. When a user taps "Continue with Apple," the Google button shows a loading spinner, even though nothing is happening with Google. The loading spinner should only appear on the button the user tapped. While it's loading, the other buttons can be grayed out so they can't be tapped, but they should keep their normal text and icons. This applies to both screens.

● Paywall redesign + first reflection on the paywall

I've attached images of both new paywall designs (the main paywall and the Welcome back paywall) so you can see exactly what they should look like. The main paywall replaces both current paywall screens (Annual and Monthly) with one screen.

1. Onboarding flow change

Remove the AI summary page that currently shows right after “Let’s try your first check in.”

When the user taps “Save & reflect,” run the concerning-words check first (see section 8). If the entry isn’t flagged, send it to OpenAI right away, using the reflection tone they picked earlier in onboarding. The reflection should generate in the background while they create their account, so it’s ready by the time they reach the paywall.

If the user taps “Skip for now,” generate the reflection from the answers they gave during onboarding instead, starting the moment they tap it.

If the user picked two reflection tones in onboarding, the first reflection blends both, the same way regular reflections work now. This applies whether it’s written from their entry or from their onboarding answers.

The entry and reflection must be saved and attached to the user’s account once they sign up, so nothing is lost.

2. Paywall layout (top to bottom)

Progress bar at the top, full.

Header: “[First name], your reflection is waiting” in the serif heading font. The header should split evenly across two lines (balanced line breaks), so the name never ends up alone on a line, no matter how long it is.

Reflection card (purple card):

Small label at the top with the sparkle icon:

If they journaled: “WRITTEN FOR YOU”

If they skipped: “BASED ON YOUR ANSWERS”

The first sentence of their real reflection, fully readable.

The rest of the reflection blurred.

A white pill under it with a lock icon: “Start your trial to read the rest”

Three benefits, each with a purple checkmark:

Understand your moods week by week

Reflections written in the tone you chose

Share with the people you trust

Plan cards, stacked:

Annual (selected by default): purple border, “Best value · Save 50%” tag in the top right corner, “5-day free trial” under the name. Price on the right: “$29.99/yr” as the main price, with “$59.88” crossed out and “$2.50/mo” in smaller text underneath. $29.99/yr must stay the biggest price on the card, since that’s what users are actually charged (Apple requires this).

Monthly: gray border, “No free trial” under the name, “$4.99/mo” on the right.

Tapping a card selects it.

Trial timeline, in one row: Today (Full access), Day 3 (We remind you), Day 5 (Trial ends).

Button: “Start my 5-day free trial,” with “No charge today. Cancel anytime.” under it, and then “Restore purchases · Terms · Privacy” as links.

3. When Monthly is selected

Change the button to “Start monthly plan.”

Change the text under it to “Cancel anytime.”

Hide the trial timeline, since there’s no trial on the monthly plan.

4. Saving the reflection in the app

If they journaled: the reflection is attached to their first journal entry, like any other entry, so they can open it from the Journal tab and read the full thing.

If they skipped: save the answers-based reflection as a “Welcome reflection” card at the top of the Journal tab. Tapping it opens the full reflection.

The card stays there until the user chooses to delete it. It should never disappear on its own.

Add a small ••• menu on the card with a “Delete” option. Before deleting, show a confirmation: “Delete your welcome reflection? This can’t be undone.” with “Delete” and “Cancel” buttons.

This way, “Start your trial to read the rest” is always true.

5. Edge cases

Reflection still generating: if the user reaches the paywall before the reflection is ready (for example, after a very fast Sign in with Apple), show “Writing your reflection...” in the card, then show the reflection as soon as it’s ready.

Reflection fails to load: show “Failed to load” in the card with a “Try again” button. Tapping it retries generating the reflection inside the card, without restarting the paywall or losing the user’s plan selection.

Entry triggers the concerning-words check (onboarding): the entry is saved privately with no AI reflection, and the crisis resources pop-up shows first. After they close it and reach the paywall, the reflection card uses the answers-based reflection, with the “BASED ON YOUR ANSWERS” label. The answers-based reflection is also saved as the “Welcome reflection” card at the top of the Journal tab, the same way it works when a user skips the check-in.

6. Streak

If the user journals on the “Let’s try your first check in” page, that entry counts as day 1 of their streak.

If they tap “Skip for now,” it doesn’t count, and their streak starts with their first real journal entry in the app.

7. Entries with concerning words (applies everywhere: onboarding and the app)

Save the entry privately, like any other entry, so the user never loses what they wrote.

Show the crisis resources pop-up as soon as the entry is saved.

Don't generate an AI reflection for that entry. Where the reflection would normally show, show a short message with the crisis resources instead: "You don't have to carry this alone. Talking to someone can help, right now," followed by the 988 and Crisis Text Line options.

Block sharing for that entry. It can't be shared to any circle, public or private. If the user tries, show: "This entry can't be shared, but support is always available," with a link to the crisis resources.

8. Subscription and safety details

Day 3 trial reminder: the timeline promises "We remind you" on Day 3, so send a push notification on Day 3 of the free trial: "Your free trial ends in 2 days." Apple doesn't send this automatically, so it needs to be built.

Trial eligibility: Apple and Google only give each account one free trial. Before showing the paywall, check whether the user is still eligible. If they're not (for example, they deleted the app and signed up again), change the button to "Start annual plan," change the text under it to "Cancel anytime," and hide "5-day free trial" on the Annual card and the trial timeline.

Prices from the stores: don't hardcode any prices. Pull them from the App Store and Google Play, so users in other countries see the right price in their own currency. The crossed-out price should be the monthly price times 12, and the per-month price should be the annual price divided by 12, both calculated from the store prices.

Concerning-words check runs first: check every entry for concerning words before it's sent to OpenAI. If it's flagged, it never gets sent, and the rules in section 7 apply.

9. Returning-user paywall (“Welcome back”)

It uses the same layout as the main paywall, with these differences:

No progress bar.

Header: “[First name], welcome back”

Purple card: label “YOUR LAST ENTRY · [DATE]” with the sparkle icon. The first line of the user’s most recent journal entry is fully readable, the rest is blurred, and the white pill says “Subscribe to open your journal.” Use the most recent entry that wasn’t flagged by the concerning-words check. If they have no entries, hide the card.

Three checkmark lines:

All [number] of your entries, right where you left them

New reflections in the tone you chose

Your circles and the people in them

“CHOOSE YOUR PLAN” label between the checkmark lines and the plan cards, in the same gray, spaced-out caps style as the app’s other section labels (like “TODAY’S MOOD”), with a bit of extra space above it.

Plan cards: same as the main paywall, but “Billed yearly” and “Billed monthly” replace the trial lines.

No trial timeline.

Button: “Start annual plan” with “Cancel anytime.” under it (or “Start monthly plan” when Monthly is selected), then “Restore purchases · Terms · Privacy.”

If the user is somehow still eligible for the free trial (per section 8), show the trial version of the button, card text, and timeline instead.

When it shows:

Subscription ended, app still installed: every time the user opens the app without an active subscription, take them straight to the Welcome back

paywall. If they cancel, they keep full access until the end of the period they already paid for, and the paywall should only show once that period actually ends.

App deleted and reinstalled: treat them as a brand-new user, starting at the beginning of onboarding. If they tap “Sign in” instead and sign in successfully:

> **No active subscription:** take them straight to the Welcome back paywall, then into the app once they subscribe.
>
> **Active subscription:** skip the paywall completely and take them straight into the app.

Check the subscription status every time the app opens, so this always reflects their current status with the App Store or Google Play.
